Re: Summer Sample Collection

***Summary of lab data:***

- *The Tees and Fairways could use another application of 0-0-50 in early to mid-August. The rate you did in June would work well.*
- *The greens need continued focus on Manganese applications- but that should wait until Fall. And currently require a 0-0-50 application at the rate of 2 pounds of product per 1,000 square feet.*

Dear Scott,

During our ride around you mentioned you thought the course was as good as it has been in June since the beginning. I believe the ryegrass is more settled in and hangs on longer and longer every year. Summertime aerification for the bermudagrass is still necessary to keep some base material but you are starting to mature to what you will be long-term, which is ryegrass for most of the calendar year. So, continue to do things like the potassium applications to extend the period it thrives in, longer. Right now, sodium is no issue in the Red-dirt areas and that certainly is good for the ryegrass.

The greens were heading into the Summer in a good way and turf coverage was excellent as usual. Sodium is not what I consider high, but the potassium levels are lower than sodium on both greens and the tissue samples had elevated sodium levels. Concentrate on 0-0-50 applications throughout the next 3 months. The weather has been mild by Las Vegas standards so far, but August is still a long month.

I have already spoken with BJ Kerzetski about soil options for the new Green Surround on #10. A sample should be at the lab sometime next week. When you and Kory have time, let's catch up and go over the details but you are in good shape according to this round of data.

Sincerely,
Corey Angelo
