

CENTENNIAL PARK SOCCER FIELDS

- As you would expect the fields show very similar results over the last five years. I wanted to note the organic material percentage which I would like to see somewhere lower than 5%. I also note the phosphorus levels to say that I would not recommend anymore fertilizers with phosphorus in them at this time. The nitrogen levels were good at the time of sample collection but if you feel the need to make an application, I'd use something that was nitrogen based and high in potassium with no phosphorus.

SUMMARY

- ☐ I did not collect the sample on the Southside football field this visit due to a baseball game being played.
- ☐ The soccer fields continue to improve and had a dense stand of turf on both.
- ☐ I would recommend at least two aerifications in the calendar year to help control the organic material increases
